Task 7

procedure function and loops: program using pl/sql
procedure, functions & loops

Aim: to implement pl/sql procedures, function & and
loops on number theory and business scenarios.

1. Simple pl/sql: program (static input)

```
DECLARE  
    message (VARCHAR2(20)) := 'Booking closed'  
BEGIN  
    dbms_output.put_line (message);  
END;
```

OUTPUT :

Booking closed

2- Condition Statement (dynamic input)

```
DECLARE  
    hid Number(3) := 100;
```

```
BEGIN
```

```
    IF (hid = 10) THEN
```

```
        dbms_output.put_line ('value of hid is 10');
```

```
    db
```

```
    ELSE IF (hid = 20) THEN
```

```
        dbms_output.put_line ('value of hid is 20');
```

```
    ELSE IF (hid = 30) THEN
```

```
        dbms_output.put_line ('value of dbms -
```

```
        Output . put - line ('value of hid is 30');
```

```
    ELSE
```

```
        dbms_output.put_line ('None of the value matching
```

```
END;
```

Output

None of the value is matching

Exact value of hid is : 190

3. Nested Loops Example

DECLARE

hid Number(1);

Did NUMBER(1);

BEGIN

< Outer-loop >

for hid Put 3 loop

< Inner-loops >

for Oid IN 1-3 loop

dbms_output.put_line (hid is = 1

hid 1 and oid is 1041)

END loop inner-loop;

END loop outer-loop;

END;

Output

hid is : 1 and oid is : 1

~~hid is : 1~~ and oid is : 2

hid is : 1 and oid is : 3

hid is : 2 and oid is : 1

hid is : 2 and oid is : 2

hid is : 2 and oid is : 3

hid is : 3 and oid is : 1

hid is : 3 and oid is : 2

hid is : 3 and oid is : 3

procedure Example

CREATE OR REPLACE PROCEDURE cooking_state (c_id IN Number)

IS

BEGIN

if (c_id > 200 THEN)

dbms_output.put_line ('Booking Open');

END IF;

END;

Output:

Booking Open

No Booking available

DI/SOL procedure for laps

Examp1: using WHILE loop with cursor prime check
using PROCEDURE print-prime Customers

CURSOR cost_cor IS

v_id Number;

v_is_prime BOOLEAN;

v_i Number

BEGIN

OPEN cost_cn;

loop

fetch cost_cor INTO v_id;

EXIT THEN cost_cor NOT FOUND;

if v_id < 2 THEN

v_is_prime = FALSE;

if v_id < 2 THEN

v_is_prime := FALSE;

ELSE;

v_is_prime := TRUE;

v_i := 2;

WHILE v_i <= TRUNC (SQRT (v_id / 1000))

if MOD (v_id, v_i) = 0 then

v_is_prime := false;

exit;

END IF;

V := V - 1;

END LOOP;

END IF;

IF V is prime THEN

DBMS_OUTPUT.PUT_LINE ('PRIME Customer

ID: || V. id);

END IF;

END LOOP;

close cur;

END;

V. ID. NUMBER - CASE	
EX NO.	07
PERFORM (1001)	5
RES (1001)	5
VIVA VOCE (1001)	5
TEST (1001)	-
MARKS (1001)	15
GRADE (1001)	D

22/9/25

~~Result:~~

Thus, the procedure function and loop program using loop are executed successfully.
